SYSTEM AND METHOD FOR FILTERING CONTENT

Abstract of the Disclosure

5   Systems and methods of presenting channel content in a distributed network having a client device and a server device, the method comprising the acts of evaluating tagged content, e.g., from the server device and creating a personalized channel at the client device. The personalized channel comprises content from two or more predetermined channels, i.e., channels received from the server device. Last, the system

10   and method displays the content on the personalized channel. Also, systems and methods may be employed to display a personalized programming guide, using profile information to select a preferred subset of information to display such that the user is better able to discern desirable content.
